Modifying ng fatty acid metabolism and producing specific p n in plants, polymers in useful seeds for increasing

Example English.

The present sequence represents the bean phaseolin terminator, which is used to construct plasmids for the expression of the P. putida faoAB gene. The gene encodes an enzyme that may be used in the method of the invention. The specification describes a method for manipulating the metabolism of a plant, and comprises expressing a heterologous gene encoding fatty acid oxidation enzymes in the cytosol or plastids other than the peroxisomes, glyoxisomes or mitochondria of the plant. The method may be used to enhance the biological production of pollyhydroxyalkanoates or novel oil compositions in a transgenic plant. Plants which may be used to produce these compounds in this way include Brassicas, maize, soybean, cottonseed, sunflower, palm, coconut, safflower, peanut, mustards, flax, tobacco alfalfa. The method may also be used to prevent or suppress seed production and therefore increase the production of biomass (leaves, stems, stalks) by plants. and

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. Th sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.

The patent discloses hypoallergenic transgenic soybeans and recombinant CC expression constructs to lower soybean vacuolar protein, commonly known CC as P34 (Gly m Bd 30K or Gly m 1) and other allergens such as Gly m IA, CC Gly m IB, rGLY m3 or Glycinin Gl (alaBlb). The allergen content of the CC soybean is reduced by sense suppression which is accomplished by using CC the expression construct that comprises a nucleic acid fragment encoding CC transgenic soybean plants which can be used to make hypoallergenic CC transgenic soybean plants which can be used to make hypoallergenic copbean products which can be used to make hypoallergenic CC formulas) and animal feed applications. The oil made from seeds of the hypoallergenic transgenic soybean plants can be used as ingredients, CC as coatings, as salad oils, as spraying oils, as roasting oils. The foods in which the oil made be used include crackers and snack foods, confectionery products, syrups and toppings, sauces, CC batter and breading mixtures, baking mixes and doughs. The present CC cor KTi3), a minor soybean seed allergen.
                                                                                                                                                                                                                                                                                                                                                                                 Recombinant expression construct to lower allergen (e.g. content of a soybean, comprises a nucleic acid fragment allergen, useful for producing soybean plants which can be allergen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (DUPO)

                       The inventors claim recombinant plasmids contg. the cDNA of calf prorennin. Specified plasmids are pCR 10001 and pCR2001 (contg. the whole sequence plus the lac promoter region). Also new are microorganisms transformed with the plasmids, esp. E. coli CR1 (ATCC property of the plasmids).
                                                                                                                                                                                                                                                                                                                          Sequence of prorennin

The prorennin specific clones were used to screen for recombinant plasmids. Only two clones 5G3 and 15C5 were found to contain the whole prorennin sequence, with clone 5G5 having its complete coding sequence (shown here). The sequence was the same as the published sequence except for two silent mutations in codons 274 and 336 respectively, and a single mutation in codon 302 which converts the sequence to the B form of rennin. The product of prorennin, rennin is an active component of rennet which is used to clot milk in the process of making cheese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The prorennin (prochymosin) sequence was obtd.from mRNA from unweaned calf's stomach (abomasum). To identify rennin-specific mRNA species, hybridisation with rennin specific probes was performed using probes derived from the published amino acid sequence of prorennin (Foltmann et al., J. Biol. Chem. 254, 8447-8456 (1979)) (see AQ23291,2). Reverse transcriptase was used to transcribe mRNA (see AQ23291,2).

The DNA is that of a mammalian gene (open reading frame) encoding chymosin. The gene was placed in operable linkage with the al-3 promoter (see AATO3005). The al-3 gene controls the production of geranyl geranyl pyrophosphatase (GGPP) synthetase. GGPP is a precursor for carotenoids and xanthophylls. It has been shown that exposure to light increases the transcription level of GGPP synthetase 15-45 fold. Light activates a number of genes in the common bread mould, Neurospora. This can be used to regulate the expression of genes encoding heterlogous proteins, e.g. chymosin, in recombinant production systems. Use of a light-regulated promoter is a simple and effective way to control expression and allows timing to be adapted to the physiological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2209 tgttctcggtttacatggacaggaatggccaggagagcatgctcacgct 2257

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 alpha-S1-casein gene in the produ. of DNA constructs. The heterologous peptide/protein together with parts of the peptide or protein may also be human insulin-like growth factor I. The constructs provide high yields of the protein with simple recovery from the milk. Activation of the gene occurs only in the mammary gland. See also AAQ14050, AAQ14774-77.

This could overcome the shortage of prochymosin due to shortage of calf stomachs and increasing cheese prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk.
